

STICKMEN'S GUIDE TO YOUR BODY

The body is an awesome machine. From the living supercomputer inside your skull to your powerful heart, which never stops beating, every single part works together to keep you alive and well. Join the Stickmen who will take you on a tour of your remarkable body - inside and out!

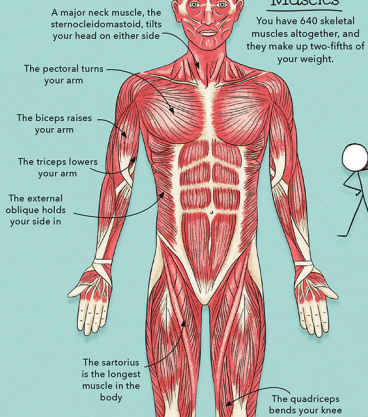

Your Beating Heart

Seeing Things

Each of your eyes is an amazing camera with a powerful built-in lens that gives you an extraordinarily clear picture of the world. And behind your eyes, your brain has a visual processing system to make instant sense of the picture.

The Skeletal Muscles

Human skeleton

Your skeleton is made of over 200 bones. Your skull, spine and ribcage make the 'axial' skeleton. Your shoulders, arms, hands, hips, legs and feet are attached to this and form the 'appendicular' skeleton.

Brain Mapping

Mouth Power

For their size, the jaw muscles are the most powerful in the body. They can bring your teeth together with enormous force. Although you don't have the biting power of a shark, you can still give a nasty nip.

Chemical Breakdown

In the gut, muscles pound the food and open it up for chemical enzymes to get to work.
